                                                                                                                                    The sequences given in AAT49874-75 are primers which were used in the amplification of rat Syk kinase mRNA. Sequences antisense to the Syk kinase mRNA, Sequences antisense to the Syk kinase mRNA, sequences antisense to the Syk kinase mRNA, were used to reduce phagocytosis of immune complexes in a mammal by introducing into phagocytic cells an inhibitor of an endogenous kinase associated with an Fc receptor on the cell membrane. Inhibition of phagocytosis modulates clearance of antibody-coated cells and immune complexes, so reduces or prevents regional tissue damage caused by monocyte or neutrophil activation, i.e. for treatment of immunological disease, e.g. autoimmune disease, caused by reaction of immune complexes and an Fc receptor, and immune disorders such as asthma. Sequences encoding the inhibitor may be introduced ex vivo and the cells then
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   gamma

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a PCR primer used in distinguishing fertility recovery properties in rice. The presence of codominant DNA marker for a gene encoding a fertility recovery in rice gene is confirmed by a PCR. A primer prepared from the rice DNA as a template is used in the PCR analysis to characterise the genotype of the gene for rice fertility recovery. The genotype of the gene can be distinguished at a fertility recovery.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Distinguishing fertility recovery property in marker confirmed by polymerase chain reaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAV01728

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents a PCR primer for rat Syk kinase. The invention relates to a method for inhibiting the signal transduction of the gamm subunit of the IgE receptor Fc epsilon RI, using a peptide inhibitor, an antisense construct. The invention also relates to a method of inhibiting the release of a mediator from a Syk-producing cell of a mammal, and a method of inhibiting the phagocytic potential of a mammalian cell expressing an Fc receptor. The methods are useful for modulating the activation of immunological processes involving Fc
New molecular marker for a gene determining fructose:glucose ratio mature tomatoes - useful for finding this gene and producing tomato seeds, plants and/or fruit with an increased fructose to glucose ra

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            fructiose:glucose ratio in mature tomatoes. Also described are: (1)
CC breeding tomato plants that produce tomatoes having superior taste
CC characteristics. At least one Lycopersicon esculentum plant is crossed
CC with a Lycopersicon spp. to produce hybrid (F1) seeds, which grow into F1
CC plants that produce seeds. These seeds produce plants, which produce ripe
CC fruit, in which the fructose:glucose content is determined using the
CC marker gene; and (2) tomato plants produced by the method, and their
CC fruit and seeds. The marker is useful for finding (and cloning) genes
CC that produce tomatoes having superior taste characteristics. The marker
CC gene is also useful in a method of breeding tomato plants for selecting
CC plants producing fruit having desired characteristics, including a higher
CC fructose:glucose ratio than that of standard L. esculetum. The molecular
CC marker enables the selection of tomato plants at the young seedling
CS stage, and eliminates undesirable environmental effects on the plant
CC phenotype, which can limit the effectiveness of selection for a phenotype
CC characteristic. The present sequence represents a primer used in
CC producing an amplification product for use as the marker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           plants that produce seeds. These seeds produce plants, which produce ripe fruit, in which the fructose:glucose content is determined using the marker gene; and (2) tomato plants produced by the method, and their fruit and seeds. The marker is useful for finding (and cloning) genes that produce tomatose having superior taste characteristics. The marker gene is also useful in a method of breeding tomato plants for selecting plants producing fruit having desired characteristics, including a higher fructose:glucose ratio than that of standard L. esculetum. The molecular marker enables the selection of tomato plants at the young seedling stage, and eliminates undesirable environmental effects on the plant phenotype, which can limit the effectiveness of selection for a phenotype characteristic. The present sequence represents a primer used in
The present invention describes a UL9 substrate comprising: a first strand (A) including a UL9 herpes replication origin sequence and a first single stranded tail 3' relative to the herpes replication origin sequence; and a second strand (B) including a sequence complementary to the UL9 herpes replication origin sequence. The UL9 substrates are usefu for detecting UL9 helicase activity in combination with ICP8 and ATP and also detecting the ability of the detecting the ability of the strate is useful for detecting the helicase activity. Immobilised UL9 substrate is useful for detecting herpes infected samples. AAA87951 to AAA87967 represent specifically claimed herpes replication origin sequences given in the present
                                                                                                                                                                                                                                                                                                                                                                                                                  Substrate for detecting helicase activity in a UL9 protein, strand including a herpes replication origin sequence and ar including a complementary sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 UL9 substrate; herpes simplex virus; HSV; herpes; detection; helicase; replication origin; infection; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      30-MAR-1998;

                                                                                                                                                                                                                                                 The present sequence is that of PCR primer Rat-3 Syk, which corresponds to nucleotides 748-762 of rat Syk man. Rat-3 Syk was used with primer Rat-5 Syk (see AAH26015) in the PCR amplification of rat Syk cDNA derived from RBL-2H3 mast cells. An experiment was performed to demonstrate inhibition of histamine release from RBL-2H3 cells by a stem-loop antisense oligonucleotide (see AAH26020) of the invention. The invention provides a claimed method of inhibiting the release of a mediator from a Syk-producing cell. This involves introducing into the cell an antisense construct that targets an Syk encoding sequence such that inhibition is effected. The cell is preferably present in the lung of an asthma patient. Also claimed is a method of treating an inflammatory condition in a patient by administering an antisense construct that targets Syk
                                                                                                                                                                    Sequence 18 BP; 4 A; 6 C; 4 G; 4 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Inhibiting the release of a mediator from a Syk-producing ce-
gene therapy for treating inflammatory conditions or asthma,
introducing into the cell Syk antisense oligonucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Syk; tyrosine kinase; rat; antisense; asthma; gene therapy; antiasthmatic; inflammation; antiinflammatory; phagocytosis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel oligonucleotide primer comprises in the following order, from 5' to 3': a phage-encoded RNA polymerase recognition sequence; a spacer sequence comprising a sequence of 12-21 nucleotides; and a target complementary sequence that can bind a segment of a target nucleic acid. The oligonucleotide primer is useful in amplifying a target nucleic acid. The primer is also useful for copying intermediate duplexes and target nucleic acids. This polymucleotide represents an example of a spacer sequence between an RNA polymerase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New oligonucleotide primer having phage-encoded RNA polymerase recognition sequences, spacer sequences and target complementary sequences, useful in nucleic acid amplification procedures or for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        07-JUN-2001;

                                                                                                                                                                                                                                                                                           5
                                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to a novel method for preventing phagocytosis of commune complexes comprises introducing an inhibitor of a kinase companies to phagocytic cells associated with an Fc receptor at the membrane of the cells under conditions so that the phagocytic potential cof the cells is inhibited. The method of the invention may have communosuppressive, dermatological, antiinflammatory, antiarthritic, antirheumatic and antiasthmatic activities and may be used as a kinase chibitor. The method and compositions of the invention may be used for modulating the clearance of antibody coated cells, viruses and soluble cantigens by inhibiting phagocytosis and modulating the interaction of commune complexes with cellular to tissue Fc receptors. The method is used for treating autoimmune diseases, immune mediated diseases e.g. asthmatic and immune complexes with cellular to tissue Fc receptors. The method is used contracting and for preventing immune complexes and rheumatoid carthritis, and for preventing immune complexes deposition in tissues e.g. the kidneys and in the joints. The present sequence represents a Rat Syk kinase specific PCR primer used to quantify expression of Rat Sky cDNA in cells treated with antisense oligonucleotides using the method of the invention.
                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                                  The invention relates to the use of constructs and compounds for modulating or regulating the clearance of antibody-coated cells or immune CC complexes from a mammal, comprising inhibiting the phagocytic potential CC of cells bearing FC receptors. The invention also relates to preventing CC phagocytosis of immune complexes in a mammal, preventing the clearance of CC immune complexes from a mammal, inhibiting the binding of immune complexes in a mammal to membrane-bound FC receptors; inhibiting the signal transduction of the gamma subunit of the IgE CC receptor FC-epsilon-RI. A method of preventing phagocytic of the IgE CC complexes pression-RI. A method of preventing phagocytic cells of the CC mammal that are in contact with the immune complexes an inhibitor of a CC kinase endogenous to the cells associated with an FC receptor present at the useful for modulating or regulating the clearance of antibody-coated CC ells or immune complexes from a mammal by inhibiting the phagocytic cells bearing FC receptors. The method is useful for inhibiting phagocytosis. The methods are also useful for treating CC inhibiting phagocytosis. The methods are also useful for treating CC diseases including asthma. This sequence represents a reverse CC transcriptase PCR (RT-PCR) primer used to amplify rat Syk mRNA used in CC the scope of the invention.

The present invention describes using a leukotriene synthesis inhibitor (I) for the manufacture of a medicament for the treatment of myocardial confinenciation or susceptibility to myocardial infarction in an individual. CC Also described is a method (M1) for the treatment of acute coronary CC syndrome (ACS) in an individual comprising administering (I). (I) has CC antiatherosclerotic, cardiant and antianginal activities, and can be used CC as a leukotriene biosynthesis inhibitor, and a leukotriene receptor CC anteagonist. (I) can be use for the manufacture of a medicament for the cCC treatment of myocardial infarction or susceptibility to myocardial CCC infarction in an individual who has at least one risk haplotype in CC infarction in an individual who has at least one risk factor chosen from CCC and and an at-risk polymorphism in the 5-lipoxygenase (5-CC LO) gene promoter; in an individual who has at least one risk factor (CC LO) gene promoter; in an individual who has at least one risk factor (CC Infammatory marker chosen from C-reactive protein (CRP), serum amyloid CC inflammatory marker chosen from C-reactive protein (CRP), serum amyloid CC A, fibrinogen, leukotriene, leukotriene metabolite, interleukin-6, tissue CC metalloprotease type-1, matrix metalloprotease type-2, matrix (CC metalloprotease type-3 and matrix metalloprotease type-2, matrix (CC metalloprotease type-3 and matrix metalloprotease type-9; in an individual having increased leukotriene synthesis; in an individual having chesterol (CC reactive protein (LPD) cholesterol, in an individual having increased leukotriene synthesis; in an individual having chesterol (CC madromesome troe or in an individual who has at heroselerosis or who creating an individual suffering from acute coronary syndrome (ACS) cevent, stable angina; or in an individual who has atheroselerosis or who creating an individual and suffering from acute coronary syndrome chosen from chosen in invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           leukotriene synthesis inhibitor; myocardial infarction; acute coronary syndrome; antiatherosclerotic; cardiant; antianginal; leukotriene biosynthesis inhibitor; leukotriene receptor antagonist; 5-lipoxygenase activating protein; FLAP; human; chromosome 13; chromosome 13q12; polymorphism; 5-lipoxygenase gene promoter; diabetes; hypertension; hypercholesterolaemia; besity; inflammatory marker; low density lipoprotein; cholesterol; high density lipoprotein; angina; atherosclerosis; microsatellite marker; high density lipoprotein; angina; atherosclerosis; microsatellite marker;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Use of leukotriene synthesis inhibitor for for treatment for myocardial infarction or infarction in individual.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Disclosure; SEQ ID NO 22; 306pp; English

                                                                                                                                                                          Detecting polymorphisms between 2 nucleic acid samples, esp. in microsatellite regions, comprises digesting the nucleic acid to generate fragments, ligating adaptor segments to their ends, amplifying them using primer directed amplification and comparing the prods. to detect differences. The primers used in the amplification comprise a primer consisting of a perfect cpd. simple sequence repeat (SSB), and an adaptor directed primer, comprising a sequence complementary to an adaptor segment. The present sequence is an example of a compound SSR primer. The method represents a modified amplified fragment length polymorphism assay, which is partic. useful for genome fingerprinting, i.e. for genetic trait marking and germplasm comparisons

```

This sequence represents a PCR primer for DNA encoding a human gamma aminobutyric acid type B (GABAB) receptor of the invention. Nucleic acid molecules encoding GABAB receptors can be used to screen for compounds that are inhibitors of transient lower ossophageal sphincter relaxations (TLESR). They can also be used to screen for agonists or antagonists of the GABAB receptors. Inhibitors of TLESR are useful for treating gastrocesphageal reflux disease. Other uses of GABAB receptors, such as human GABAB Rlc or 1d, comprise diagnosis or treatment of conditions related to GABAB dysfunction, e.g. epilepsy, psychiatric disorders, emesis, irritable bowel syndrome, dyspepsia, spasticity, arthritis, allergies, autoimmune diseases, neoplastic diseases, pain and infectious disease Example 1; Page 14; 222pp; English. ő

AAZ69579 to AAZ777440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment. N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel set of inter-simple sequence repeats (ISSR)-PCR primers for genotyping eukaryotes. The primers of the invention may be useful for genotyping diverse genomes of plant and animal systems, in particular for distinguishing Basmati rice varieties from non-Basmati rice varieties and traditional Basmati rice varieties from evolved Basmati rice varieties. The current sequence is that of the 3' anchored (ISSR)-PCR primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 19 BP; 9 A; 1 C; 7 G; 2 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New set of inter-simple sequence repeats (ISSR)-PCR primers for genotyping eukaryotes, useful for genotyping diverse genomes of plant and animal systems.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human VEGFR3 short interfering nucleic acid (siNA)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 1; SEQ ID NO 35; 60pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a double-stranded short interfering concleic acid (siNA) that downregulates expression of the vascular concleic acid (siNA) that downregulates expression of the vascular concleic acid (siNA) that downregulates expression of the vascular concleic acid (siNA) that downregulates the VEGF gene; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; (4) vectors that express siNA; and (5) single-stranded siNA with similar properties. The siNAs have antianglogenic, cytostatic, antidiabetic, ophthalmological, antiarthritic, antipsoriatic, nephrotropic and complexed that the siNA are useful for modulating compared that the siNA are potentially careful for treating a wide range of angiogenesis-associated conditions, compared that the siNA are potentially described that the siNA are potentially careful for tide that the siNA are not may also be useful for diagnosis, and polycystic kidney disease. The siNA may also be useful for diagnosis, careful studying gene function, and also for gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches

                                                         ophthalmological, antiarthritic, antipsoriatic, nephrotropic and gynaecological activities. The siNA are useful for modulating (downregulating) the expression of VEGFR genes. The siNA are potentially useful for treating a wide range of angiogenesis associated conditions, particularly cancers, diabetic retinopathy, macular degeneration, neovascular glaucoma, arthritis, psoriasis, endometriosis, angiofibroma, and polycystic kidney disease. The siNA may also be useful for diagnosis, drug screening, target identification and validation, genetic engineering, studying gene function, and also for gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence is used in the
                                                                                                                                                                                                                                                                    The present invention describes a double-stranded short interfering nucleic acid (siNA) that downregulates expression of the vascular endothelial growth factor receptor (VEGFN) gene. Also described: (1) a siNA that downregulates the VEGF gene; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; (4) vectors that express siNA; and (5) single-stranded siNA with similar properties. The siNAs have antianglogenic, cytostatic, antidiabetic, cytostatic, antidiabetic,

The primers used in the amplification comprise a primer consisting of a perfect cpd. simple sequence repeat (SSR), and an adaptor directed primer, comprising a sequence complementary to an adaptor segment. The present sequence is an example of a compound SSR primer. The method represents a modified amplified fragment length polymorphism assay, which is partic. useful for genome fingerprinting, i.e. for genetic trait marking and germplasm comparisons

Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these
                          Antisense oligonucleotides for treating hepatitis and colon, liver or lung cancer are inhibitors of Fas, Fas ligand or Fas associated prote (Fap-1) expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs encode polypeptides (see AAX36754-Y37949) which can be used as vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         modified_base
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       misc_feature
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAC61847;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAC61847 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 20

The present invention specifically claims AAH56368 to AAH56832 which are antisense oligonucleotides to nucleotide sequences encoding groE. More generally, antisense compounds (I) comprising antisense oligonucleotides of 5-50 bases targeted to a nucleotide sequence encoding groEL (heat shock protein (HSP)60) (GL) and groES (HSP)10) (GS) gene from a microorganism, where the antisense compound is complementary to GL or GS of a microorganism and specifically hybridises with and inhibits the expression of GL or GS, is claimed. (I) have antibacterial, antiviral and antiproliferative activities, and can be used in antisense therapy and for inhibition of expression of groES or groEL. (I) are useful for inhibiting expression of GL or GS in cells or tissues in vitro. (I) are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAC61841-58 represent antisense oligonucleotides which are directed against nucleic acids encoding human Fap-1 (Fas associated protein 1, protein tyrosine phosphatase). The specification describes antisense compounds which are targeted to the 5'-untranslated region, translational start site, translational termination region or 3'-untranslated region of nucleic acid molecules encoding Fas, Fas ligand (Fast), or Fap-1. The antisense compounds are used to inhibit the expression of Fas, Fast or Fap-1 in cells or tissues. They are used to treat autoimmune or inflammatory diseases such as hepatitis. They can also be used to treat cancer, especially colon, liver or lung cancer or lymphoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antisense oligonucleotide; groE; groEL; groES; inhibitor; growth; microorganism; Escherichia coli; Streptcocccus pneumoniae; diagnosis; Streptcocccus pyogenes; Staphylococcus aureus; Pseudomonas aeruginosa; antibacterial; antiviral; antiproliferative; antisense therapy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        18-NOV-1999;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      20-NOV-2000; 2000WO-CA001347

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC also useful for inhibiting the growth of a microorganism, or inhibiting Ct the expression of GL or GS gene which involves administering to the CV virus) having a GL or GS gene which involves administering to the CC microorganism or to a cell infected with the microorganism, (I). (I) are also useful for treating a mammalian pathological condition mediated by CC the microorganisms which involves identifying a eukaryotic organism CC driving a pathological condition mediated by microorganisms having a GL or GS gene and administering (I) such that the growth of microorganism is CC inhibited. The antisense compounds are utilised for diagnostics, CC therapeutics, prophylaxis and as research reagents and kits, e.g., to CC prevent or delay microbial infections in humans. They are also useful as CC molecular weight markers. AAH5632 to AAH56337 and AAH56833 to AAH56854 CC exemplification of the present invention. AAH56855 to AAH56870 represent CC groE nucleotide sequence given in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

ITS DNA sequences from M. fortuitum, M. chelonae, M. abscessus, M. vaccae, M. flavescens, M. asiaticum, M. porcinum, M. acapulcensis, M. disrnhoferi genes were identified. The oligonucleotides derived from these sequences were used to develop PCR primers and hybridisation probes for detection and identification of Mycobacterium. ITS has a more polymorphic region than 16S rRNA and also has a conserved region. It is therefore highly effective as a target DNA for distinction of genotype. The oligonucleotide probes, attached to solid substrate, hybridise only with nucleotide sequences in ITS of specific mycobacteria, and thus they can detect and identify the specific mycobacteria sensitively. The oligonucleotides can also detect and identify the specific mycobacteria by PCR amplification. Using the oligonucleotide primers or probes made from 17S of mycobacteria, it is possible to detect mycobacteria distinguish tuberculosis (TB) complex from non-tuberculosis mycobacteria distinguish tuberculosis (TB) complex from non-tuberculosis mycobacteria
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

This invention relates to an antisense compound encoding Fas, Fas ligand, or Fas associated protein-1 (Fap-1). The inhibition of Fas mediated signalling is thought to be immunosuppressive, antiinflammatory, hepatotropic, cytostatic and vasotropic. Antisense oligonucleotides were
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ABN79637 standard; DNA;

Oligonucleotides were synthesised as chimeric oligonucleotides and are useful for treating an animal having autoimmune or inflammatory disease e.g., hepatitis, cancer, a condition associated with apoptosis, allograft rejection, or ischemia reperfusion injury. Optionally, the above mentioned conditions are prevented by contacting the allograft with the antisense oligonucleotide. The oligonucleotides are used in diagnostics, therapeutics, prophylaxis and as research reagents and in kits. The oligonucleotides are also useful for research purposes. The present nucleotide sequence is related to
                                                      New compounds antisense to nucleic acid encoding human necrosis factor receptor 2 are useful to treat disease mouse tumor necrosis factor receptor 2 expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ABQ74856 standard;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match
                                                                                                                                                                                                                                     The invention relates to a microarray comprising a support, a first probe for genotyping Mycobacterium species, second probe for differentiating Mycobacterium therculosis strains, and a third probe for detecting antibiotic-resistant strains, where the probes are immobilized on the support. This sequence represents an example of the first probe used for genotyping Mycobacterium species. The array is useful for simultaneously genotyping Mycobacterium species, differentiating M. tuberculosis strains and detecting antibiotic-resistant strains
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Microarray for simultaneously genotyping Mycobacteria species, differentiating Mycobacterium tuberculosis strains and detecting antibiotic-resistant strains, comprises specific probes on a support of the strains of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      or mouse TNFR2 comprising contacting cells or tissues in vitro with or of the claimed compounds. The antisense compounds are used to treat a disease or condition associated with expression of TNFR2. The present sequence represents a mouse TNFR2 antisense chimeric phosphorothicate oligonucleotide, which is given in the present invention

                                                                                                                                                                                                                                                                                                    RESULT 1276
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC The invention relates to a novel polynucleotide isolated and purified CC from a human gene having any one of 935 fully defined sequences as given CC in specification, or a sequence having a base substitution. The invention CC further relates to: an oligonucleotide containing single nucleotide polymorphisms; a PCR primer set chosen from the combination of two DNA CC fragments from any one of 1220 fully defined sequences as given in CC specification; a labelling probe containing the SNP containing oligo; and CC amicroarray equipped with the SNP containing oligo. The isolated human CC gene of the invention is useful for detecting the single nucleotide CC polymorphisms in human gene. The isolated human gene is also useful for CC fie isolated human gene is also useful for CC The isolated human gene is also useful for CC The isolated human gene. This polynucleotide sequence represents CC one of the PCR primers used in the single nucleotide polymorphism CC detection method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

Autoimmune diseases include Addison's diseases, atrophic gastritis. Degenerative nervous system diseases include multiple selections and Alzheimer's disease. Hypersensitivity diseases include multiple selections such as contact with allergens that lead to allergies. Type II hypersensitivities such as those present in Goodpasture's syndrome and Type IV hypersensitivities such as those present manifested in leptosy. Infectious diseases include viral infections manifested in leptosy. Infections diseases include viral infections caused by viruses such as HIV, fungal infections such as those caused by the yeast genus Candida, parasitic infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by schistosomes, filaria and bacterial infections as the caused by schistosomes, filaria and bacterial infections and as those caused by schistosomes, filaria and bacterial infections and as those caused by schistosomes, filaria and bacterial infections and as those caused by schistosomes, filaria and bacterial infections and as those caused by schistosomes, filaria and bacterial infections and as those caused by schistosomes, filaria and bacterial infections and as those caused by schistosomes, filaria and bacterial infections and as those caused by schistosomes, filaria and bacterial infections and as those caused by schistosomes, filaria and bacterial infections and as those caused by schistosomes, filaria and bacterial infections and as those caused by schistosomes, filaria and bacterial infections and a those caused by schistosomes and cancers such as those processes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Addison's disease; atrophic gastritis; degenerative nervous system disease; multiple sclerosis; Alzheimer's disease; hypersensitivity disease; type I hypersensitivity; allergy; type II hypersensitivity; Goodpasture's syndrome; type IV hypersensitivity; leprosy; infectious disease; viral infection; HIV; fungal infection; Candida; parasitic infection; schistosome;

The invention enables the detection of a single nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.
                        The present invention relates to antisense compounds targeted to nucleic acids encoding human Fas (also known as Apo-1 or CD95), Fas ligand (FasH, also Apo-1) and CD951), and Fas associated protein 1 (Fag-1). The antisense compound comprises an antisense oligonucleotide that specifically hybridises with one of the said nucleic acids and inhibits Fas, FasH or Fap-1 mediated signal transduction. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense
                                                                                                                                                                                                                                                                              New antisense oligonucleotides of 20-50 nucleobases, useful for treating autoimmune or inflammatory diseases, and cancer.

The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotides are useful for the treatment of autoimmune or inflammatory diseases, and cancers associated with overexpression of constitutive activation of Fas, FasL, or Fap-1. The present sequence represents an antisense oligonucleotide used in the examples of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention describes an antisense compound 8-30 or 8-50 nucleobases in clength targeted to the 5'-untranslated region, translational start site, translational termination region or 3'-untranslated region of a nucleoic acid molecule encoding Fas, Fas ligand or Fap-1. Also described are: a pharmaceutical composition comprising the anti-sense compound and a pharmaceutical carrier or diluent; a method of inhibiting the expression of Fas or Fap-1 in cells or tissues: treating an animal having a disease or condition associated with Fas or Fap-1; anda preventing allograft rejection, ischaemia reperfusion injury or apoptosis in an allograft recipient. The antisense compound and pharmaceutical composition is useful in diagnosing, treating or preventing autoimmune or inflammatory disease, e.g. hepatitis, cancer, e.g. cancer of the colon, liver, lung or a lymphoma, apoptosis, allograft rejection, e.g. cardiac, renal, hepatic or skin allograft and ischemia reperfusion injury.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             method is useful for determining if a patient has cancer, or is at increased risk of developing cancer, e.g. breast, carrier, or is at patient has cancer, or is at patient has cancer, or is at increased risk of developing cancer; by hybridising a nucleic acid sample to the nucleic developing cancer; by hybridising a nucleic acid sample to the nucleic acid sequences from the array, and detecting the presence of mutations in FA/BRCA pathway genes in the nucleic acid sample from the patient, where detecting the presence of mutations is indicative of a patient who has cancer, or is at increased risk of developing cancer. A method of the invention is useful for screening a chemosenstitising agent, and the agent obtained is useful for treating a patient having a cancer. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              patient has cancer or is at increased risk of cancer, involving testing a Fanconi Anaemia (FA)/BRCA pathway gene or protein for the presence of a cancer-associated defect, where the presence of one or more cancer-associated defects is indicative of cancer or an increased risk of cancer in the patient. The method of the invention has cytostatic activity. The method is useful for determining if a patient has cancer, or is at the cancer of the cancer or is at the c
                                                             This invention relates to a novel library of immunoglobulin (IGG) molecules. Specifically, it refers to prototype IGG molecules that each may comprise a mutation where a single predetermined amino acid has been substituted in one or more positions within one or more of the six
                                                                                                                                                                                                                                                                                                                                                                                                                            New libraries for a prototype IgG (IgG) comprising mutated IgG or nucleic acids encoding a mutated IgG, useful for generating specific information on particular mutations that alter interaction of an IgG with its
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel method of diagnosing or determining if patient has cancer or is at increased risk of cancer, involving testing Fanconi Anaemia (FA)/BRCA pathway gene or protein for the presence of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   GP120; antibody; scFV; ss; library; immunoglobulin; IgG; prototype;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Best
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match
           Detecting polymorphisms between 2 nucleic acid samples, esp. in microsatellite regions, comprises digesting the nucleic acid to generate fragments, ligating adaptor segments to their ends, amplifying them using primer directed amplification and comparing the prods to detect differences. The primers used in the amplification comprise a primer consisting of a perfect cpd. simple sequence repeat (SSR), and an adaptor directed primer, comprising a sequence complementary to an adaptor segment. The present sequence is an example of a compound SSR primer. The method represents a modified amplified fragment length polymorphism assay, which is partic. useful for genome fingerprinting, i.e. for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              monoclonal antibody (scFV). The present invention describes a method for generating a library of prototype mutant IgGs (for example IgM, IgA, IgD or a Fab fragment of IgG), which can be used to study protein structure and function via a walk-through mutagenesis procedure. Accordingly, the libraries may be used for the systematic analysis of the binding regions of prototype IgG molecules. Furthermore, it provides specific information regarding particular mutations that alter the interaction of an IgG with its antigen, including multiple interactions by amino acids of the varying CDRs. This oligonucleotide sequence is a degenerate human GP120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Detection; polymorphism; perfect compound simple sequence repeat; adaptor directed primer; genome; genetic; fingerprinting; amplified fragment length polymorphism assay; microsatellite region; genetic trait marking; germplasm comparisons; compound; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Best Local
                                                                                                                                  The invention relates to the preparation of microarrays, which involve the oxidation of chemical groups present on a solid support surface to allow the formation of aldehyde functions upon the surface. The aldehyde functions covalently couples with capture molecules designed for the detection, identification, quantification and/or the recovery of complementary target biological or chemical molecules. For preparing microarrays e.g. biochips or chemochips to detect, quantify and/or recover e.g. nucleotide sequences, ligands or antibodies, from sample e.g. detecting transcriptional factors. This polynucleotide sequence
                                                                                                                                                                                                                                                                                                    Preparation of microarrays e.g. biochips, involves oxidation of chemical groups present upon the support surface and allowing the formation of aldehyde functions at the surface of the solid support.
                                                                              represents a PCR primer used to amplify the femA gene sequence fro Staphylococcus aureus. This sequence is used in a method of the invention, involving the detection of target nucleotide amplicons short capture nucleotide sequences fixed on glass slides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Microarray; oxidation; solid support surface; aldehyde function; biochip; capture molecule; chemochip; PCR; primer; femA gene; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides a method of identifying or quant microorganism in a sample by detecting its nucleotide sequence amongst homologous sequences. The method can be used to detect microorganisms and polymorphisms, and to diagnosis genetic discincluding cancer. The present sequence is a consensus primer u exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Remacle J,

New isolated NOVX polypeptide useful for treating atherosclerosis, metabolic disorders, diabetes, obesity, infectious disease, anore, neurodegenerative disorders, Alzheimer's disease and cancer. disease, anorexia, nd cancer.

Page 666pp; English.

The invention relates to human polypeptides, termed NOVX, and the polymucleotides encoding them. The polypeptides and polymucleotides are useful for diagnosing disease, and screening for potential therapeutic agents. The sequences are useful for treating metabolic disorders, cardiomyopathy, diabetes, hypertension, congenital heart defects, aortic stenosis, atrial septal defect (ASD), atrioventricular cannal defect, ductus arteriosus, pulmonary stenosis, subaortic stenosis, ventricular septal defect (VSD), valve diseases, tuberous sclerosis, scleroderma, septal defect (VSD), valve diseases, tuberous sclerosis, scleroderma, the control of the co atherosclerosis, obesity, infectious disease, anorexia, neurodegenerative disorders, Alzheimer's disease, Parkinson's disease, immune disorders,

                                                               The present invention relates to a method for modulating gene expression in a cell. The method comprises modulating a binding interaction between an alphaCP polypeptide and a Hur polypeptide. The invention also discloses mRNA stabilising elements involved in the binding of alphaCP1, alphaCP2 and Hur proteins to mRNA. The method of the invention is useful for modulating gene expression, stabilising vascular endothelial growth factor (VEGF) mRNAs, for inducing angiogenesis, for treating mammalian diseases (e.g. coronary diseases, cardiac diseases, cancer), and identifying modulators of gene expression. The present sequence represents a mRNA stabilising element of the invention
                                                                                                                                                                                                                     Modulating gene expression in a cell useful for preparing a composition for treating cancer by modulating a binding interaction between an alpha CP polypeptide and a HuR polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Modulating gene expression; alphaCP1; alphaCP2; HuR protein; mRNA stabilising element; vascular endothelial growth factor; VEGF; mRNA stabilisation; angiogenesis; coronary disease; cardiac disease cancer; cytostatic; ss.

                                                                                                                                                                                                                                                                             The invention relates to a novel set of inter-simple sequence repeats (ISSR)-PCR primers for genotyping eukaryotes. The primers of the invention may be useful for genotyping diverse genomes of plant and animal systems, in particular for distinguishing Basmati rice varieties from non-Basmati rice varieties and traditional Basmati rice varieties from evolved Basmati rice varieties. The current sequence is that of the 5' anchored (ISSR)-PCR primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                     New set of inter-simple sequence repeats (ISSR)-PCR primers i genotyping eukaryotes, useful for genotyping diverse genomes

Colman SD,
               The invention relates to human G-protein coupled receptor (GPCR) polypeptides and the polynucleotides encoding them, designated GPCRX. The invention also relates to a cettor comprising a GPCRX nucleic acid, a cell comprising the vector, an antibody that binds immunospecifically to a GPCRX polypeptide, methods for determining the presence or amount of the polypeptide or the nucleic acid molecule in a sample, methods for
                                                                                                                                                                                                                                                      useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 retinal disease; urinary retention; angina pectoris; Crohn's disease; schizophrenia; manic depression; primer.

The composition and methods are useful in diagnosing, preventing or treating GPCRX-associated disorders, such as cardiomyopathy, atherosclerosis, diabetes, obesity, infections, cancer, Alzheimer's disease, Parkinson's disease, asthma, allergies, hypertension, retinal diseases, urinary retention, anglna pectoris, Crohn's disease, schizophrenia and manic depression. The nucleic acids are further used as hybridiastion probes, in chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The polypeptides are also useful as vaccines or as immunogens to produce antibodies. This sequence represents a PCR primer used to amplify human GPCRX cDNA of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           neuropathological effects of diabetes, AIDS, neuropathy, and leprosy. Populars AAC61052-C61061 are used in the invention for the amplification of DNA sequences encoding GAPDH, RALDH II (retinaldehyde dehydrogenase type 2 - formed during retinoic acid synthesis), and retinoid-X-receptors. These PCR primers are used in the invention during the isolation and characterisation of the retinoic acid receptors
                                                                                                               The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (I) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle
                                                                                                                                                                                                                                                      Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
                                                                                                                                                                                                                       Example 1; Page 351; 408pp; English.

(I) and (II) are useful for treating proliferative sk diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They ca also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy o prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic bur scar. AAH57577 to AAH62099 represent sequences used in the exemplification of the present invention

Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.

Example 1; Page 216; 408pp; English.

dependent kinase, growth factor or a reductase, or administering nucleic acid molecule (II) comprising a promoter operably linked nucleic acid segment encoding (I). (I) can have antipsoriatic, dermatological, cytostatic, antiseborrheic, antidiabetic, antisic The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (I) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle antisickling ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

Claim 1;

Page 57; 87pp; English

This invention relates to the use of a retinoic acid receptor beta 2 (RARbeta2) and/or its agonist in the preparation of a medicament to concern development. RARbeta2 mediates the cellular effects of the vitamin A derived molecule retinoic acid. Sequences AAC61031-C61051 represent PCR primers specific for RARalpha, RARbeta, and RARgamma DN sequences. The retinoic acid receptor of the invention exhibits mootropic, neuroprotective and neurleptic activities. A method using RARbeta2 to cause neurite development can be used for treating neurological disorders comprising neurological injury. Neurological disorders include Parkinson's disease, Alzheimer's disease, senility.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a radiation hybrid map of the dog (Canine familiaris) genome comprising the genome location of a marker selected from AAA6613 to AAA66942. The radiation hybrid map is useful for identifying and localising dog genes, since it covers approximately 80 % of the dog genome and provides a dense map integrating different types (i.e. Type I and Type II) of markers. The map and the dog genome markers (or complementary sequences) are especially useful to identify genes responsible for phenotypic and behavioural traits in dogs, to identify morbid genes, to analyse diseases and identify implicated genes in such diseases and their alleles, and to study dog pedigrees. They may also be useful for isolating corresponding human gene sequences e.g. genes
                                                                                                                                                                        Use of retinoic acid receptor beta 2 or its agonist development and treating neurological disorder such disease, Alzheimer disease and schizophrenia.
                                                                                                                                                                                                                                                                                                                                                                     05-OCT-2000.

Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient
                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 19

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment. N.B. The SEQ ID NOs 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        at a PG1-related biallelic marker. The methods can be used to detect and to assess the risk of developing cancer or prostate cancer. Early-stage diagnosis of prostate cancer relies on prostate specific antigen (PSA) dosage. However, the effectiveness of this is limited due to its inability to discriminate between malignant and non-malignant affections of the organ. A need exists for both a reliable diagnostic procedure which would enable early-stage diagnosis, and for preventative and curative treatments of the disease. The PGI gene can be used for detection of prostate cancer, and the risk of developing it in the
                                                      New hairpin and hammerhead ribozyme RNA encoding a cyclin or cell-cycle PCNA and Cyclin B1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a mammalian PG1 gene and protein, and a set of PG1 biallelic markers. The PG1 polynucleotide and biallelic markers are used in a hybridisation assay, a sequencing assay, or in an allelespecific amplification assay for determining the identity of a nucleotide
